

Operative Hysteroscopy: Before Your Procedure

What is an operative hysteroscopy?

An operative hysteroscopy is a procedure to find and treat problems with your uterus. It may be done to remove growths from the uterus. It may also be used to treat fertility problems or abnormal bleeding.

The doctor will guide a lighted tube through the cervix and into the uterus. This tube is called a hysteroscope, or scope. The doctor will fill your uterus with liquid. This makes it easier to see the inside of your uterus with the scope. Then the doctor will put tools through the scope to do the procedure.

Most of the liquid that the doctor puts in will flow out when the scope is removed.

You will most likely go home the same day. Many women are able to go back to work the next day. But it depends on what was done and the type of work you do.

Follow-up care is a key part of your treatment and safety. Be sure to make and go to all appointments, and call your doctor if you are having problems. It's also a good idea to know your test results and keep a list of the medicines you take.

What happens before the procedure?

Preparing for the procedure

- Understand exactly what procedure is planned, along with the risks, benefits, and other options.
- Tell your doctors ALL the medicines, vitamins, supplements, and herbal remedies you take. Some of these can increase the risk of bleeding or interact with anesthesia.

- If you take blood thinners, such as warfarin (Coumadin), clopidogrel (Plavix), or aspirin, be sure to talk to your doctor. He or she will tell you if you should stop taking these medicines before your procedure. Make sure that you understand exactly what your doctor wants you to do.
- Your doctor will tell you which medicines to take or stop before your procedure. You may need to stop taking certain medicines a week or more before the procedure. So talk to your doctor as soon as you can.
- If you have an advance directive, let your doctor know. It may include a living will and a durable power of attorney for health care. Bring a copy to the hospital. If you don't have one, you may want to prepare one. It lets your doctor and loved ones know your health care wishes. Doctors advise that everyone prepare these papers before any type of surgery or procedure.

Procedures can be stressful. This information will help you understand what you can expect. And it will help you safely prepare for your procedure.

What happens on the day of the procedure?

- Follow the instructions exactly about when to stop eating and drinking. If you don't, your procedure may be canceled. If your doctor has instructed you to take your medicines on the day of the procedure, take them with only a sip of water.
- Take a bath or shower before you come in for your procedure. Do not apply lotions, perfumes, deodorants, or nail polish.
- Take off all jewelry and piercings. And take out contact lenses, if you wear them.

At the hospital or surgery center

- Bring a picture ID.
- You will be kept comfortable and safe by your anesthesia provider. The anesthesia may make you sleep. Or it may just numb the area being worked on.
- The procedure will probably take less than an hour.

Going home

- Be sure you have someone to drive you home. Anesthesia and pain medicine make it unsafe for you to drive.
- You will be given more specific instructions about recovering from your procedure. They will cover things like diet, wound care, follow-up care, driving, and getting back to your normal routine.

When should you call your doctor?

- You have questions or concerns.
- You don't understand how to prepare for your procedure.
- You become ill before the procedure (such as fever, flu, or a cold).
- You need to reschedule or have changed your mind about having the procedure.
